Dr. Shirley Jackson

By: Jay Duggal, Matthew Ritten, and Youssef Ahmar

Dr. Shirley Jackson and her Career in Tech

- Born on August, 5th, 1946.
- One of only two women in her undergraduate class at MIT, and the first black woman to earn a PhD from MIT.
- At Bell Labs, she helped create touch-tone telephone, fiber-optic cables, caller ID, and call waiting.
- Appointed Head of the Nuclear Regulatory Commission, President of Rensselaer Polytechnic Institute, and recipient of the Medal of Science.

Tech of Today

Touch-tone dialing has evolved into digital telecommunication systems, as used in our cellphones and computers.

Fiber-optic cables form the backbone of modern, global internet and high-speed data transfer.

Caller ID and call waiting became precursors to today's mobile notification systems and contact management.

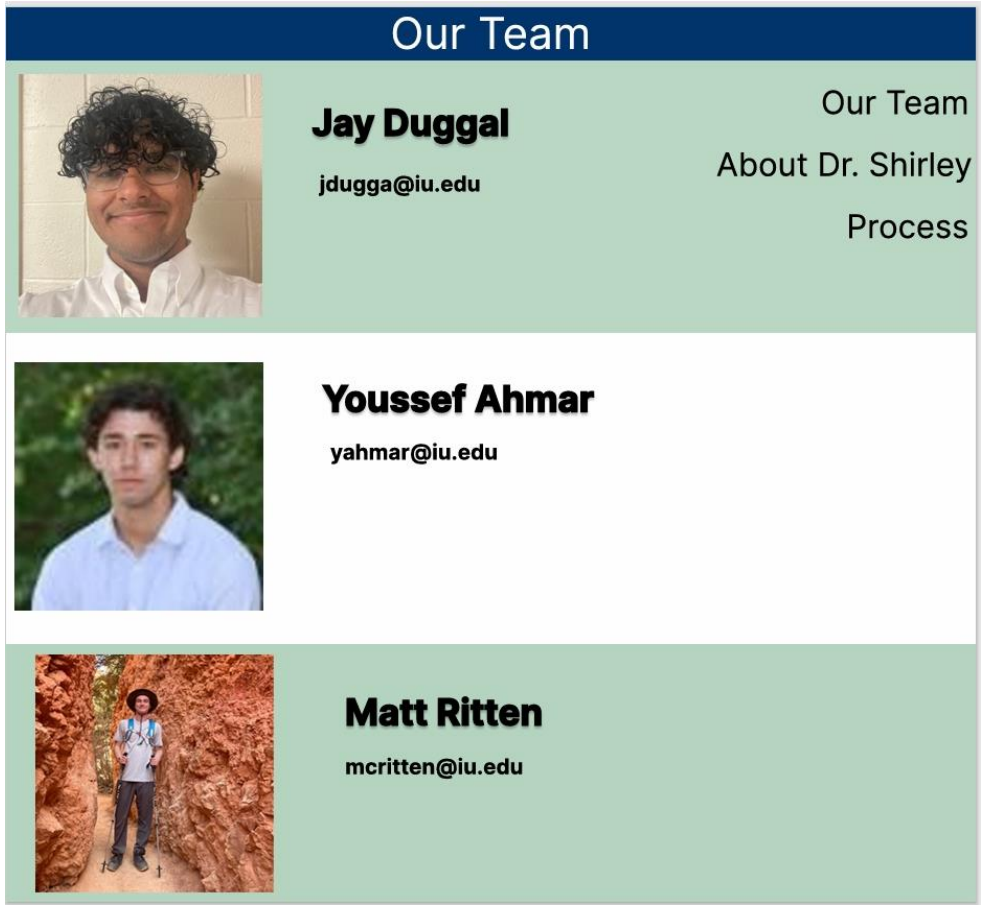
Trailblazing Tech

Fiber-optic technology is critical to 5G internet and will be pivotal to creating 6G internet.

Her innovations make it easier for the world to be more connected through Bluetooth and WiFi.

Caller ID's and call waiting innovations are still crucial aspects of modern telecommunication.

She paved the way for more black women to pursue and influence the world of technology.

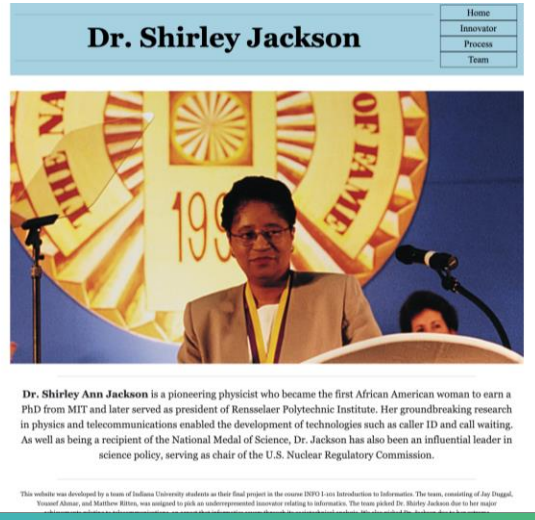


Wireframe Model

Our Process pt.1

- Began by choosing Dr. Jackson, and planning our process.
- Gained a deeper understanding through research.
- Created a wireframe model of the website.
- Developed a website draft using the wireframe.

Website Draft



Final Website

Our Process pt.2

After our Website draft,

+ we gained feedback on user interactions with the site,
+ organized our data in order to identify crucial revisions,
+ then applied our knowledge to a final website draft.

We also assembled this slideshow in order to present all of our work.
